

23.03.2017

LLC Dneprovsky Pipe Works has developed a project for the production of waterproofing with extruded polyethylene pipes of the following dimensions:

Ø 42 - 168mm

Ø 508 - 1420 mm

Extruded polyethylene is a polymer material from which the anti-corrosion coating of steel pipes in water pipelines and gas supply networks is made.

This coating protects the metal from contact with moisture, stray currents, and prevents the appearance of rust and fungus.

Subject to the rules for its application, the service life of steel communications increases several times.

At this stage, preparatory work has been carried out and the workshop has been prepared for installation
